

Dear students,

I inform you about my expectation what should be included in the log file for programming Assignment 5.

Your program should send enough output to the log file such that it is possible for me to determine its operation. For example:

Process with PID 3 was created

Process with PID 3 request the following resources

Resources for process with PID 3 were granted

Operating system detected that process PID 3 is deadlocked

Operating system kill the process with PID 3

There are no more deadlocked processes, the process with PID 4 begining running

Additionally, you can have used such messages as:

Process with PID 6 was terminated

Process with PID 7 is running

Etc.

You can add to some messages the time, for example: "at time 0:272656.
